## What is metabolic syndrome? 甚麼是代謝綜合症?

Metabolic syndrome is the presence of central obesity along with high glucose (diabetic mellitus or pre-diabetes), high blood pressure, high triglycerides and low HDL (good cholesterol).

Metabolic syndrome increases the risk of hypercholesterolemia (high LDL-cholesterol), fatty liver and atherosclerosis. Untreated fatty liver can result in liver failure and atherosclerosis can lead to ischemic heart disease, stroke and peripheral vascular disease. Therefore, early detection and treatment of metabolic syndrome are important.

代謝綜合症是指包括中央肥胖、高糖症(糖尿病或糖尿前期)、高血壓、高三酸甘油酯及「高密度膽固醇」偏低的症候群。

代謝綜合症大大提升了患有壞膽固醇過高、脂肪肝及血管粥樣化的風險。嚴重的脂肪肝能導致肝衰竭，而血管粥樣化可引致心臟病、中風以及下肢血管閉塞等問題。因此，及早發現及治理尤其重要。
