What is Osteoporosis?

甚麼是骨質疏鬆症？

Osteoporosis is a disease of the bone associated with aging. Normally, our bones undergo dynamic resorption and buildup throughout our lives. With aging, bone build-up slows down and is unable to keep up with bone resorption. The bones become “porous” and weak, leading to high risks of low impact fracture.

Fracture usually occurs in the hips and spine, leading to disturbing back pain, or in severe cases, nerve damage, which can severely impair mobility and possibly precipitate mortality.

骨質疏鬆是一種與年紀有關的骨骼疾病。正常的骨骼會處於持續被吸收及建造的狀態。但隨著年紀漸大，身體建造骨骼的速度減慢，趕不上吸收的速度，因此骨質密度會下降，增加骨折風險。

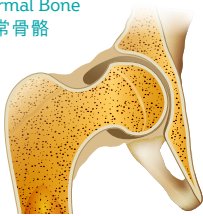

骨質疏鬆相關的骨折通常發生在脊骨或髖骨位置，輕則引致背痛，嚴重則可導致神經線受損，影響活動能力，或增加死亡風險。
